

## The Cantilever Racking Specialists

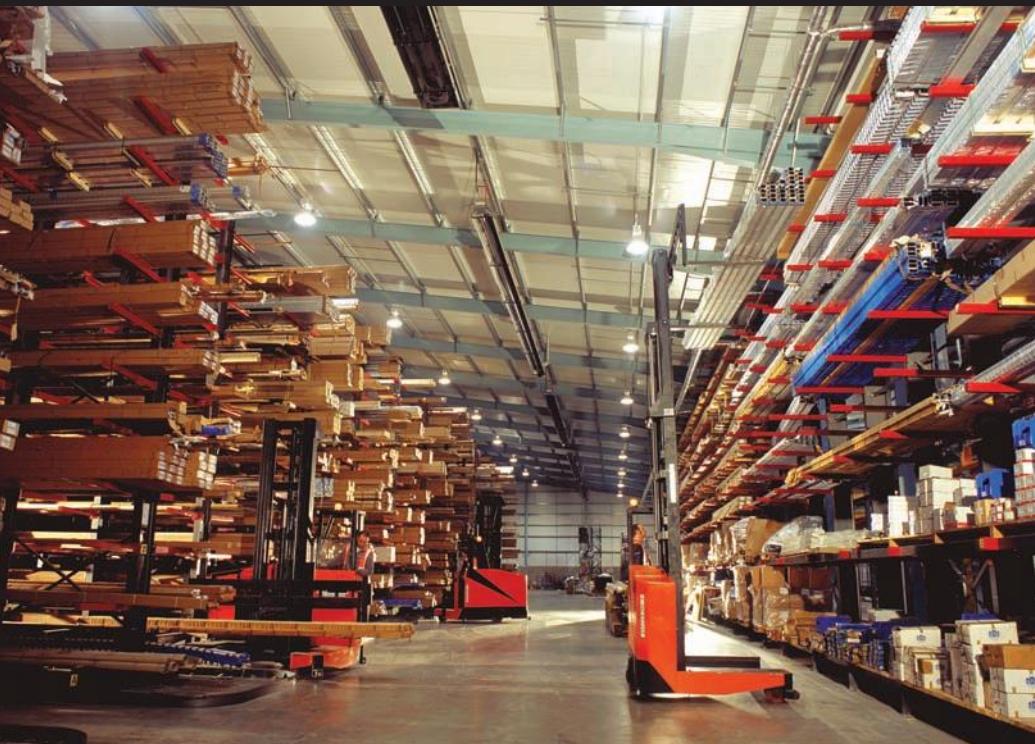

Pro-Dek offer a full design, manufacturing and installation service for the production of high quality cantilever racking. All our systems are individually tailored to your precise requirements covering: product size, type and quantity; the available space; handling methods and stock movement or rotation requirements.

After initial consultation, our sales and design team will prepare a proposal to assist in eliminating the inefficiencies associated with mixed stock storage, particularly long and awkward shaped loads. Our racking can be used to complement existing storage facilities or provide the optimum use of available space for new installations. Our aim is to generate a safer, tidier and better looking working environment leading to a more efficient and productive workplace and workforce. Single or double sided racking can be supplied in either free standing or top tied variations. Designed from box section and 'I' beams, our racking offers a range of flexibility and versatility which can be tailored to your individual storage needs and stock movements.

Our racking products are manufactured under close supervision utilising high quality rolled steel sections. We are able to undertake the production of large load bearing structures or incorporate the cantilever design principle into other special projects such as rack supported buildings and many other derivatives.
